

How to Access Current Sampler and Regex Variable in JMeter BeanShell Post Processor?

Apache JMeter get current sampler as follows:

```
1 String currentURL = ctx.getCurrentSampler().getUrl().getHost();//accessing current URL
2 name = vars.get("takipKodu");//regex variable named as takipKodu
3
4 // Pass true if you want to append to existing file
5 // If you want to overwrite, then don't pass the second argument
6 f = new FileOutputStream(currentURL+".txt", true);
7 p = new PrintStream(f);
8 this.interpreter.setOut(p);
9 print(name);
10 f.close();
```
