

Multiple SelectBox Usage in Laravel

We can use following codes for multiple select in Laravel:

Blade Template:

```
<div class="form-group col-sm-6">
  {!! Form::label('project_contents', 'Project Contents:') !!}
  <i>(You can choose multiple items)</i>

  @if(!isset($project))
  {{Form::select('project_contents',$project_contents,null,
  array('data-placeholder'=>'Seçiniz','class' => 'form-control select','multiple'=>'multiple',
  'name'=>'project_contents[]','required'=>''))}}
  @endif
  @if(isset($project))
  <select multiple="multiple" name="project_contents[]" id=project_contents"
    class="form-control select" required="required">
    @foreach($project_contents as $aKey => $content)
    <option value="{{ $aKey }}"
      @if(in_array($aKey,$project->project_contents)) selected="selected"@endif>
      {{$content}}
    </option>

    @endforeach
  </select>
  @endif
  <div class="help-block with-errors"></div>
</div>
```

Controller:

```
1 public function store(HttpRequest $request)
2 {
3     $input=$request->all();
4     $input['project_contents'] = json_encode($input['project_contents']);
5 }
6 public function edit($id)
7 {
8     $project = $this->projectRepository->find($id);
9
10    return view('projects.edit')->with('project', $project)
11        ->with("project_contents", $this->getProjectContents());
12 }
13 private function getProjectContents()
14 {
15     $projectContents = ProjectContent::pluck('name', 'id');
16     $projectContents = $projectContents->toArray();
17     return $projectContents;
18 }
```

Project model

```
1 class Product extends Model
2 {
```

```
3     public $table = 'products';
4
5     public $fillable = [
6         'project_contents'
7     ];
8
9     protected $casts = [
10        'project_contents' => 'array',
11    ];
12
13 }
```
