

org.hibernate.HibernateException: createQuery is not valid without active transaction

**Problem:** org.hibernate.HibernateException: **createQuery** is not valid without active transaction

**Solution:** If you are using `<prop key="hibernate.current_session_context_class">thread</prop>`, remove this. Because:

When using spring and spring managed transactions never mess around with the `hibernate.current_session_context_class` property **UNLESS** you are using **JTA**.

Spring will by default set its own **CurrentSessionContext** implementation (the `SpringSessionContext`), however if you set it yourself this will not be the case. **Basically breaking proper transaction integration.**

The only reason for changing this setting is if you want to use JTA managed transactions, then you have to setup this to properly integrate with JTA.
